TCP Variants

TCP-Reno (loss-based)

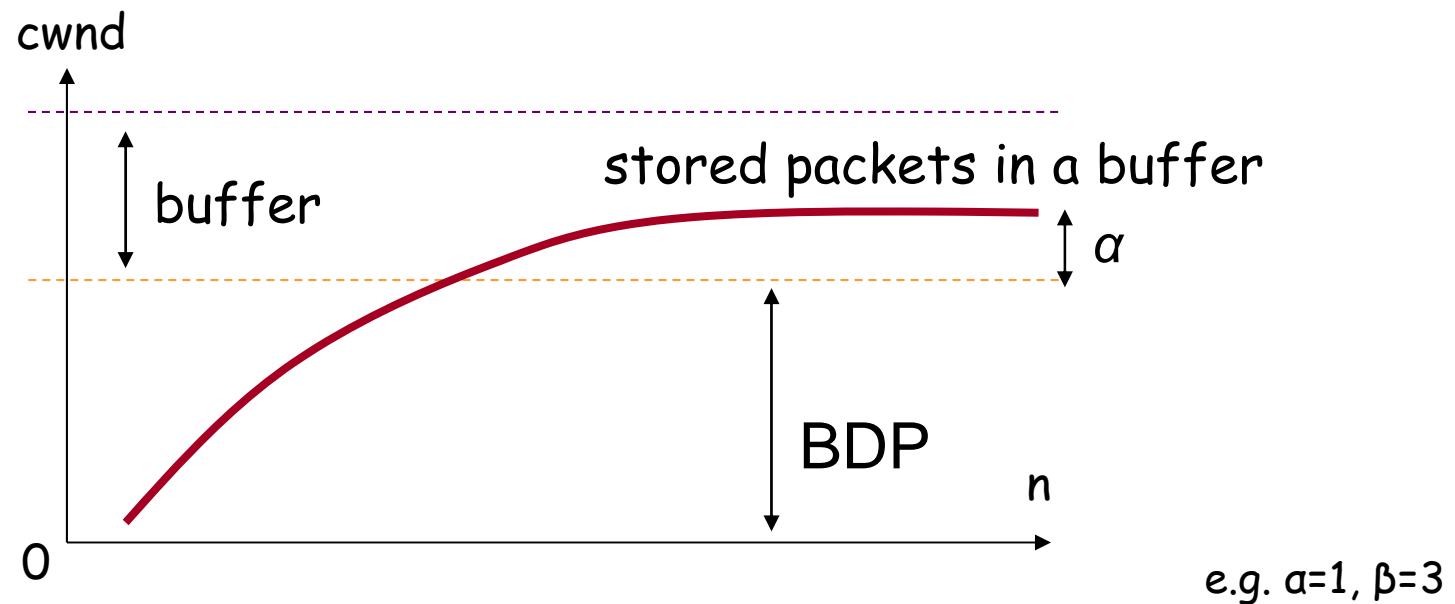

increase: $cwnd = cwnd + 1/cwnd$

decrease: $cwnd = cwnd / 2$

AIMD: additive increase multiplicative decrease

TCP-Vegas (delay-based)

$$diff = \left(\frac{cwnd}{RTT_{min}} - \frac{cwnd}{RTT} \right) \cdot RTT_{min}$$

stored packets in a buffer

increase:

$$cwnd = \begin{cases} cwnd + 1 & diff < \alpha \\ cwnd & otherwise \\ cwnd - 1 & diff > \beta \end{cases}$$

decrease:

$$cwnd = cwnd * 0.75$$

TCP problems, 15 years ago

- broadband wired networks
 - slow window increase (inefficiency)
 - deployment of wireless networks
 - cannot distinguish wireless errors and buffer overflow
-
- TCP-Reno (NewReno, SACK) problem
 - Reno expels Vegas (unfriendliness)

TCP Variants in the 21th century

- **Loss-driven (AIMD)**
 - TCP-Reno / NewReno / SACK
 - High-Speed TCP (IETF RFC 3649, Dec 2003)
 - Scalable TCP (PFLDnet 2003)
 - BIC-TCP / **CUBIC-TCP** (IEEE INFOCOM 2004, PFLDnet 2005)
... Linux
 - H-TCP (PFLDnet 2004)
 - TCP-Westwood (ACM MOBICOM 2001)
- **Delay-driven (RTT Observation)**
 - TCP-Vegas (IEEE JSAC, Oct 1995)
 - FAST-TCP (INFOCOM 2004)
- **Hybrid**
 - Gentle High-Speed TCP (PfHSN 2003)
 - TCP-Africa (IEEE INFOCOM 2005)
 - **Compound TCP** (PFLDnet 2006) ... Windows (proposed by MSR)
 - Adaptive Reno (PFLDnet 2006)
 - YeAH-TCP (PFLDnet 2007)
 - TCP-Fusion (PFLDnet 2007) ... our lab

Loss-based TCPs

	<i>a</i>	<i>b</i>
Variants	Increase / Update	Decrease
TCP-Reno	1	0.5
aggressive	HighSpeed TCP (HS-TCP)	$a(w) = \frac{2w^2 \cdot b(w) \cdot p(w)}{2 - b(w)}$ <p>e.g. 70 (10Gbps, 100ms)</p> $b(w) = \frac{\log(w) - \log(W_{low})}{\log(W_{high}) - \log(W_{low})} (b_{high} - 0.5) + 0.5$ <p>e.g. 0.1 (10Gbps, 100ms)</p>
	Scalable TCP (STCP)	0.01 (per every ACK)
	BIC-TCP	$\begin{cases} \text{additive increase (fast)} \\ \text{binary search (slow)} \\ \text{max probing (fast)} \end{cases}$
	CUBIC-TCP	$w = 0.4(t - \sqrt[3]{2W_{max}})^3 + W_{max}$
adaptive	H-TCP	$\alpha \leftarrow 2(1 - \beta)\{1 + 10.5 \cdot (t - TH)\}$ $\beta \leftarrow \begin{cases} 0.5 & \text{for } \left \frac{B(k+1) - B(k)}{B(k)} \right > 2 \\ \frac{RTT_{min}}{RTT_{max}} & \text{otherwise} \end{cases}$
	TCP-Westwood (TCPW)	$\begin{cases} RE * RTT_{min} / PS & (\text{not congested}) \\ BE * RTT_{min} / PS & (\text{congested}) \end{cases}$

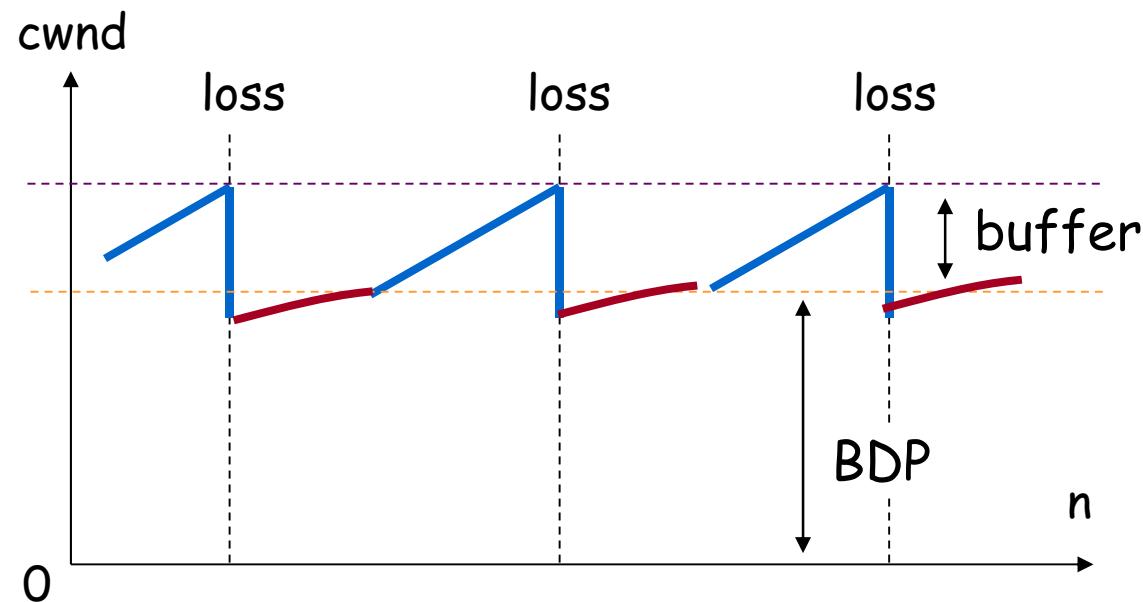

Delay-based TCPs

a

b

Variants	Update	Decrease
TCP-Vegas	$w \leftarrow \begin{cases} w+1 & (\text{no congestion}) \\ w & (\text{stable}) \\ w-1 & (\text{early congestion}) \end{cases}$	0.75
FAST-TCP	$w \leftarrow \min \left\{ 2w, (1-\gamma)w + \gamma \left(\frac{RTT_{\min}}{RTT} w + \alpha \right) \right\}$	0.5 (?)

Hybrid TCP

- RTT increase: loss mode \Rightarrow improvement of friendliness
- no RTT increase: delay mode \Rightarrow improvement of efficiency

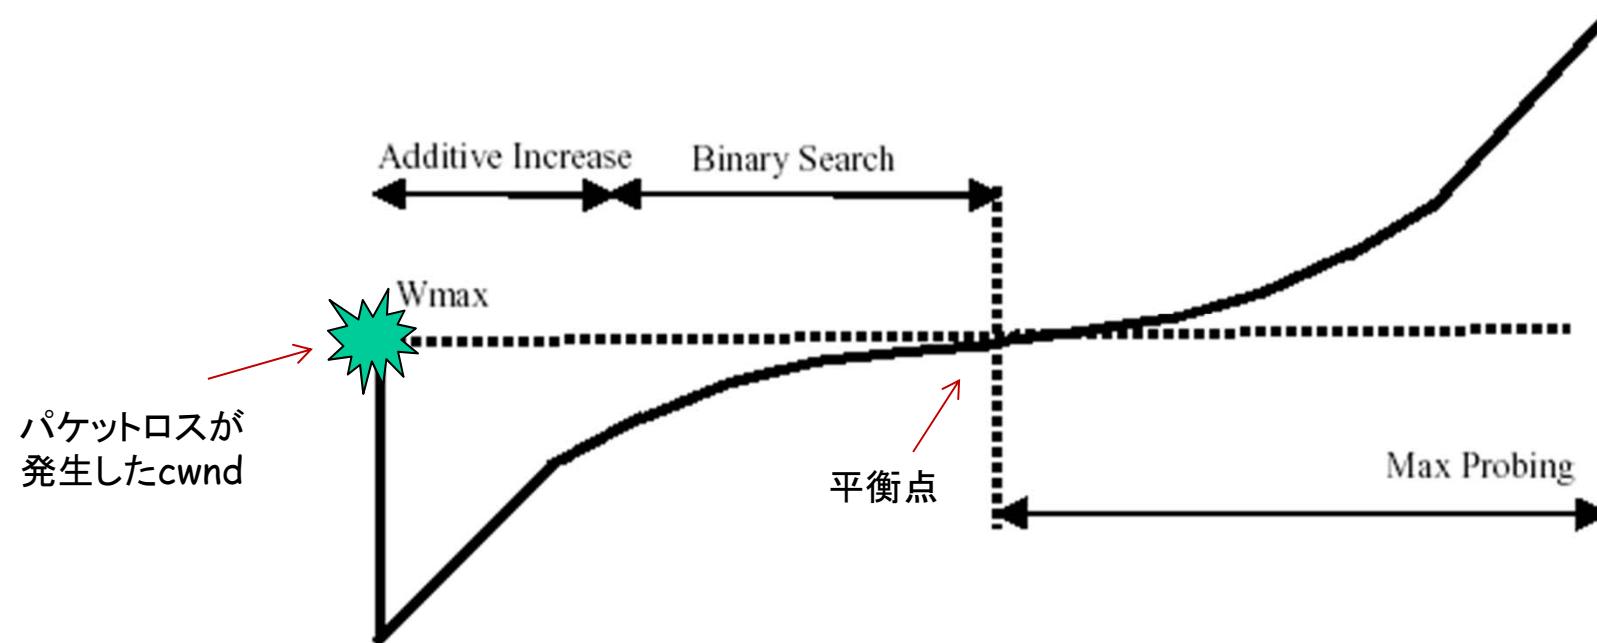

Hybrid TCPs

	a	b	
	Variants	Increase	Decrease
simple	Gentle HS-TCP	HS-TCP / Reno	HS-TCP
	TCP-Africa	HS-TCP / Reno	HS-TCP
adaptive	Compound TCP (CTCP)	$0.125 \cdot cwnd^{0.75}$ / Reno	0.5
	Adaptive Reno (ARENO)	$B/10\text{Mbps}$ / Reno	$\begin{cases} 1 & (\text{non congestion loss}) \\ 0.5 & (\text{congestion loss}) \end{cases}$
adaptive	YeAH-TCP	STCP / Reno	$\max\left(\frac{RTT_{\min}}{RTT}, 0.5\right)$
	TCP-Fusion	$\frac{B * D_{\min}}{PS}$ / Reno	$\max\left(\frac{RTT_{\min}}{RTT}, 0.5\right)$

CUBIC-TCP
(Linux default)

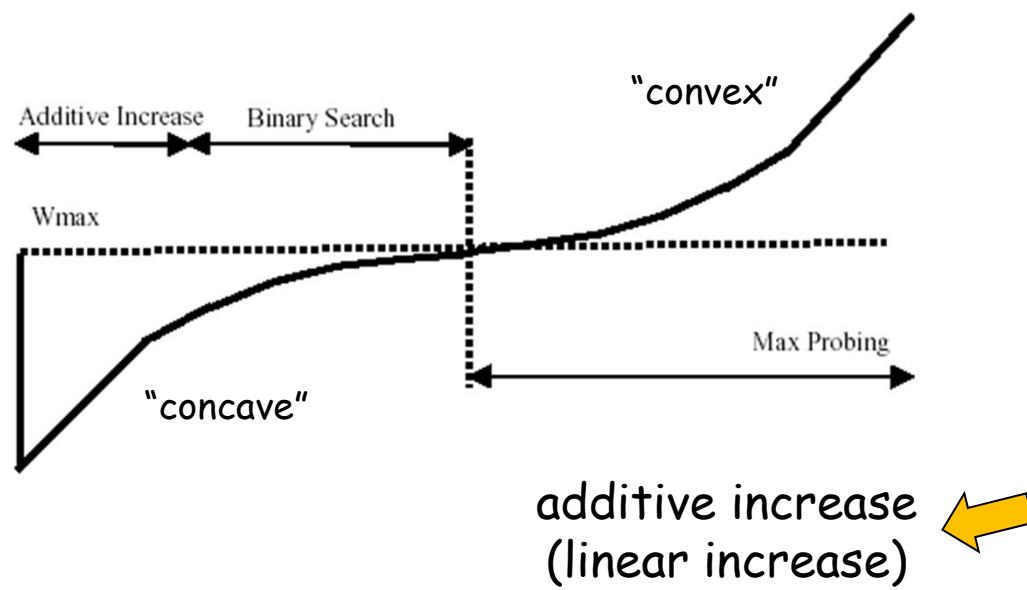

BIC-TCP (1)

- Binary Increase Congestion Control

BIC-TCP (2)

- Window Increase

W_{max} : cwnd when a last loss happened

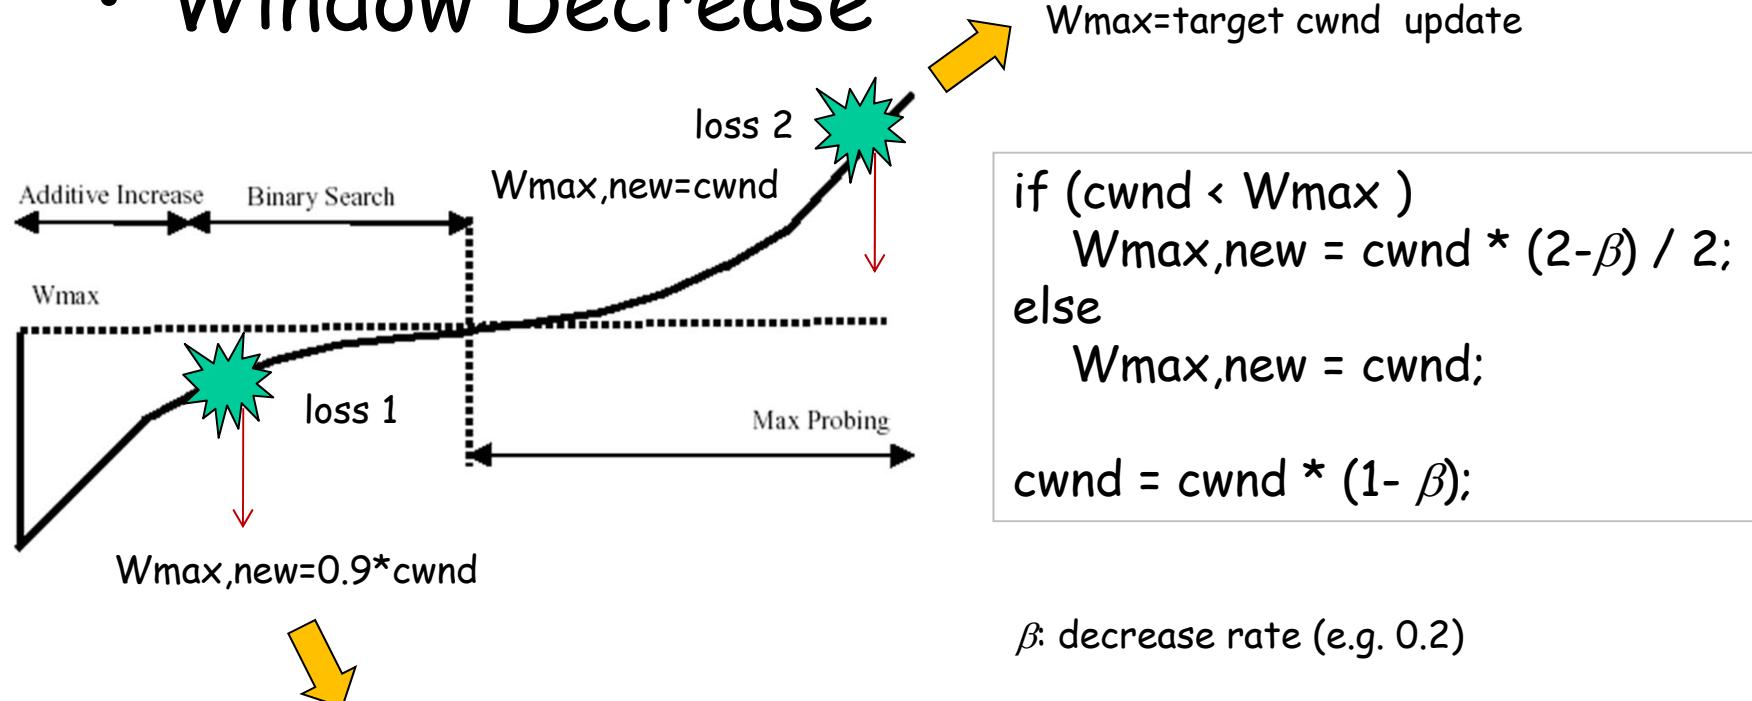

S_{max} : maximum increase rate (e.g. 32)

S_{min} : minimum increase rate (e.g. 0.01)

```
binary search  
if (cwnd < Wmax )  
    Winc = (Wmax - cwnd) / 2;  
else  
    Winc = (cwnd - Wmax) / 2;  
  
if (Winc > Smax)  
    Winc = Smax;  
elseif (Winc < Smin)  
    Winc = Smin;  
  
cwnd = cwnd + Winc / cwnd;
```

BIC-TCP (3)

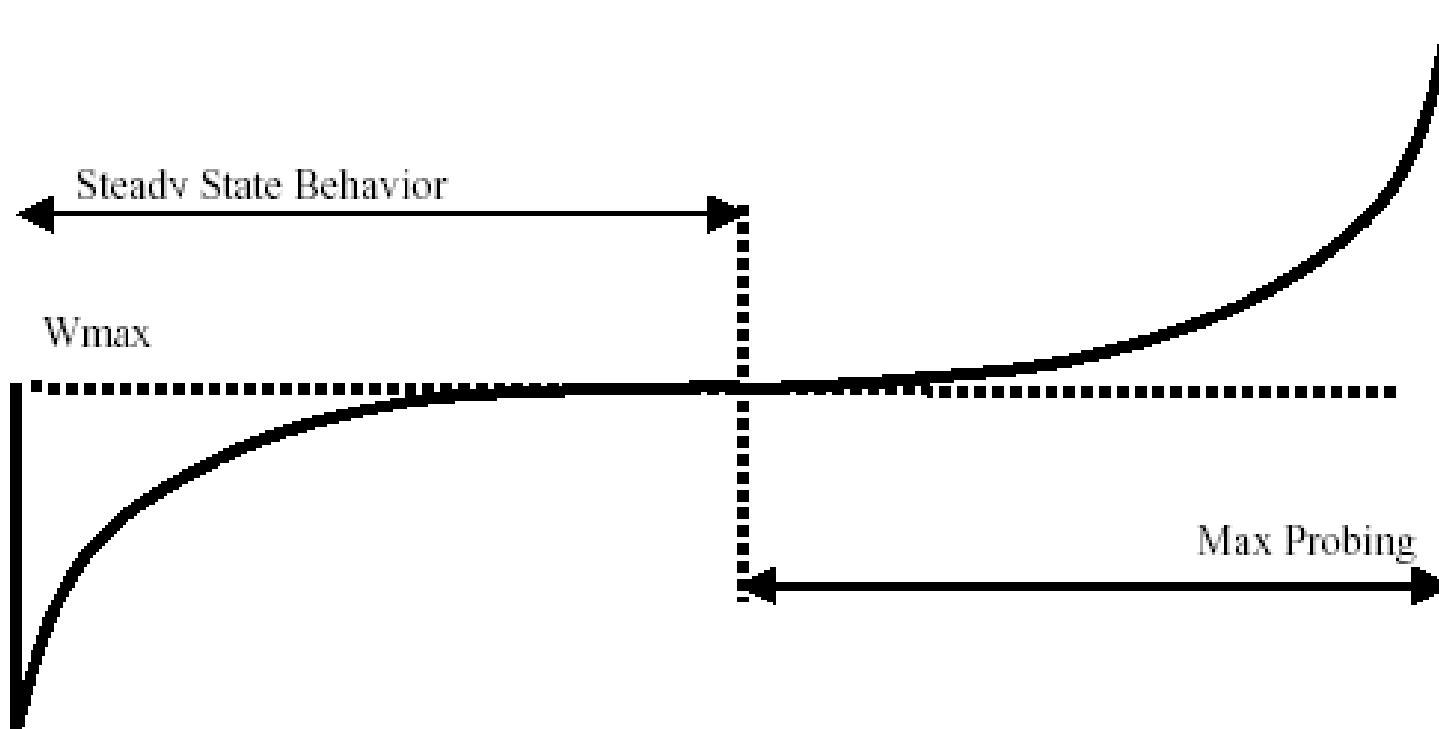

- Window Decrease

*0.9: give bandwidth to newly-coming flows
... "Fast Convergence"

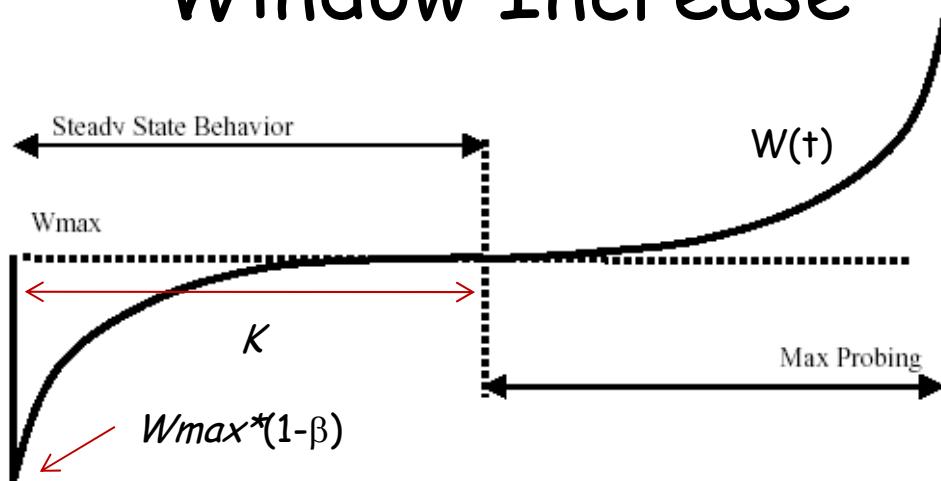

CUBIC-TCP (1)

- Cubic approximation of BIC-TCP

CUBIC-TCP (2)

- Window Increase

$$W(t) = C * (t - K)^3 + W_{\max}$$

$$K = \sqrt[3]{\frac{W_{\max} \beta}{C}}$$

$$W_{tcp}(t) = W_{\max} (1 - \beta) + 3 \frac{\beta}{2 - \beta} \frac{t}{RTT}$$

equivalent to Reno

```
/* cubic function */
Winc = W(t+RTT) - cwnd;
cwnd = cwnd + Winc / cwnd;

/* TCP mode */
if ( Wtcp > cwnd )
    cwnd = Wtcp;
```

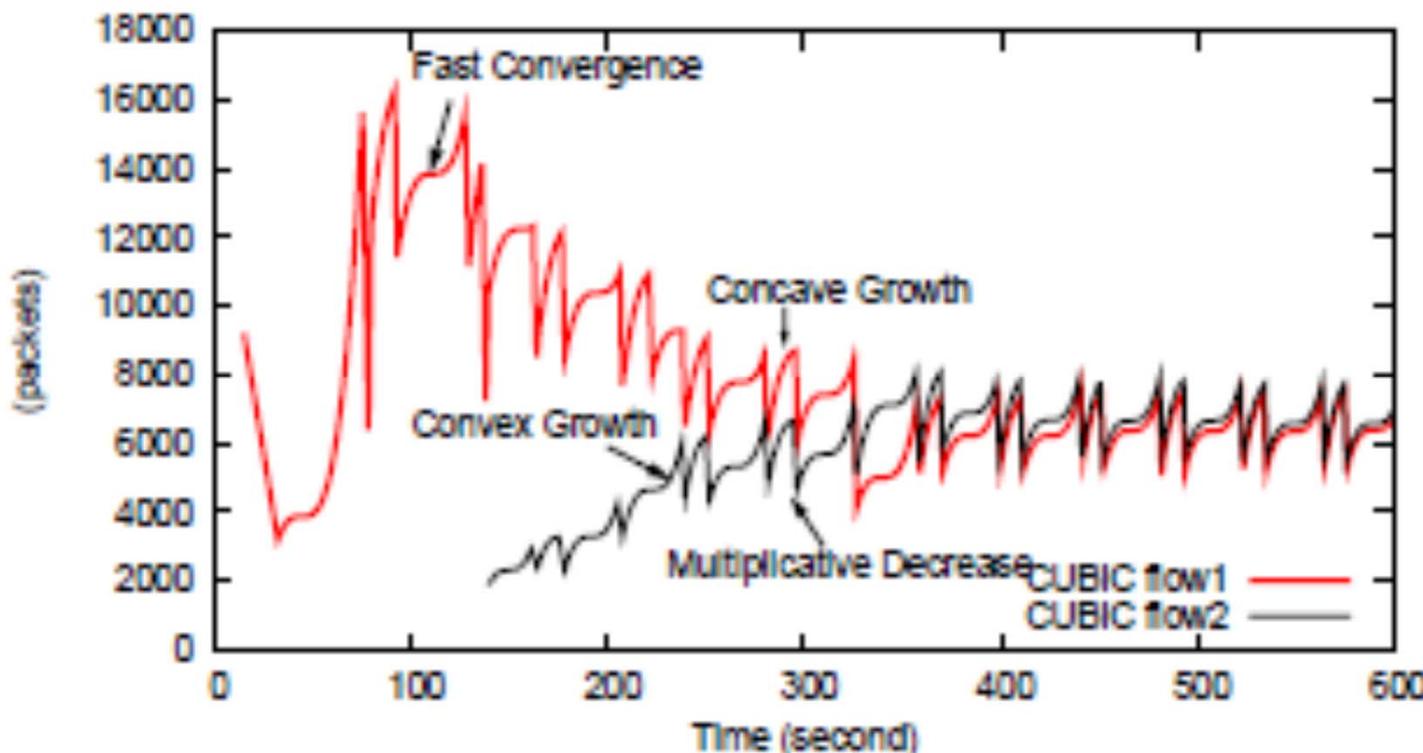

※ window decrease is the same as BIC

β : decrease rate (e.g. 0.2)

C : constant (e.g. 0.4)

CUBIC-TCP (3)

- CUBIC's cwnd behavior

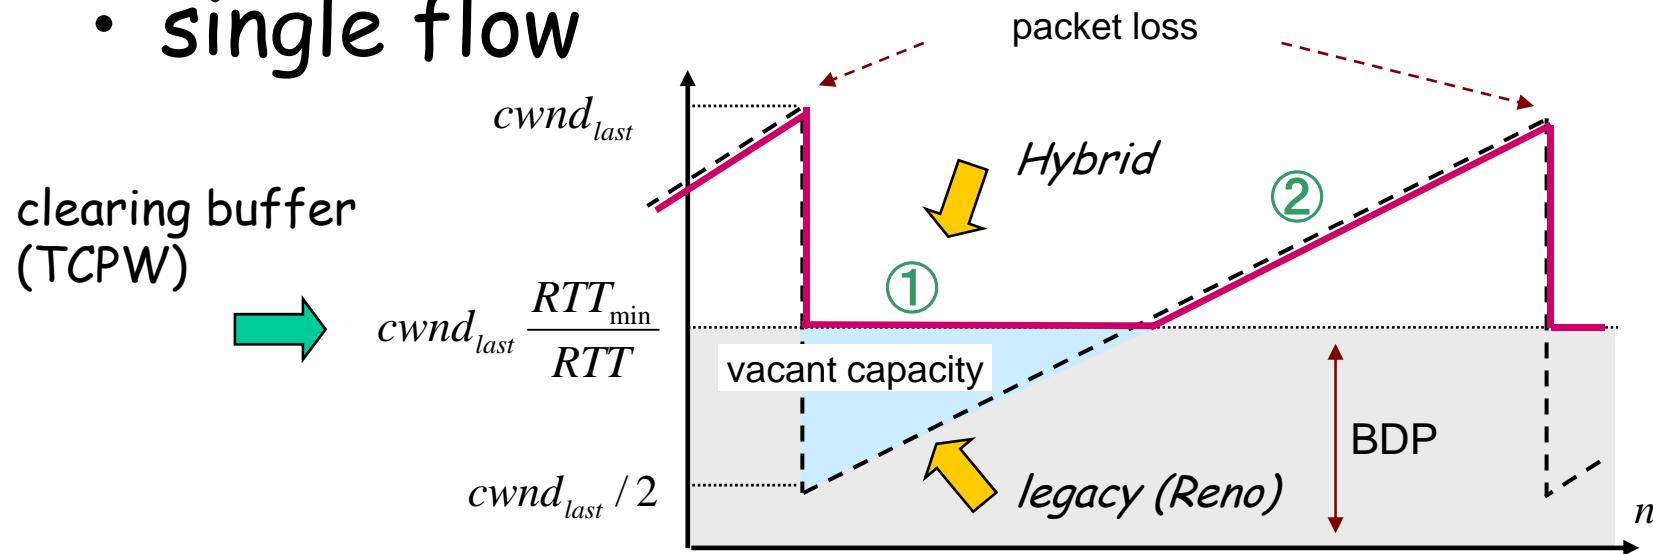

CUBIC-TCP (4)

- Advantages
 - stability
 - “intra-protocol fairness” among multiple CUBIC flows
- Disadvantages
 - heavy buffer occupancy and delay increase (\Leftrightarrow delay-based)
 - “inter-protocol unfairness” against other TCP flows
 - “Linux beats Windows!” (vs. Compound TCP)

Hybrid TCPs

Hybrid TCP (1)

- single flow

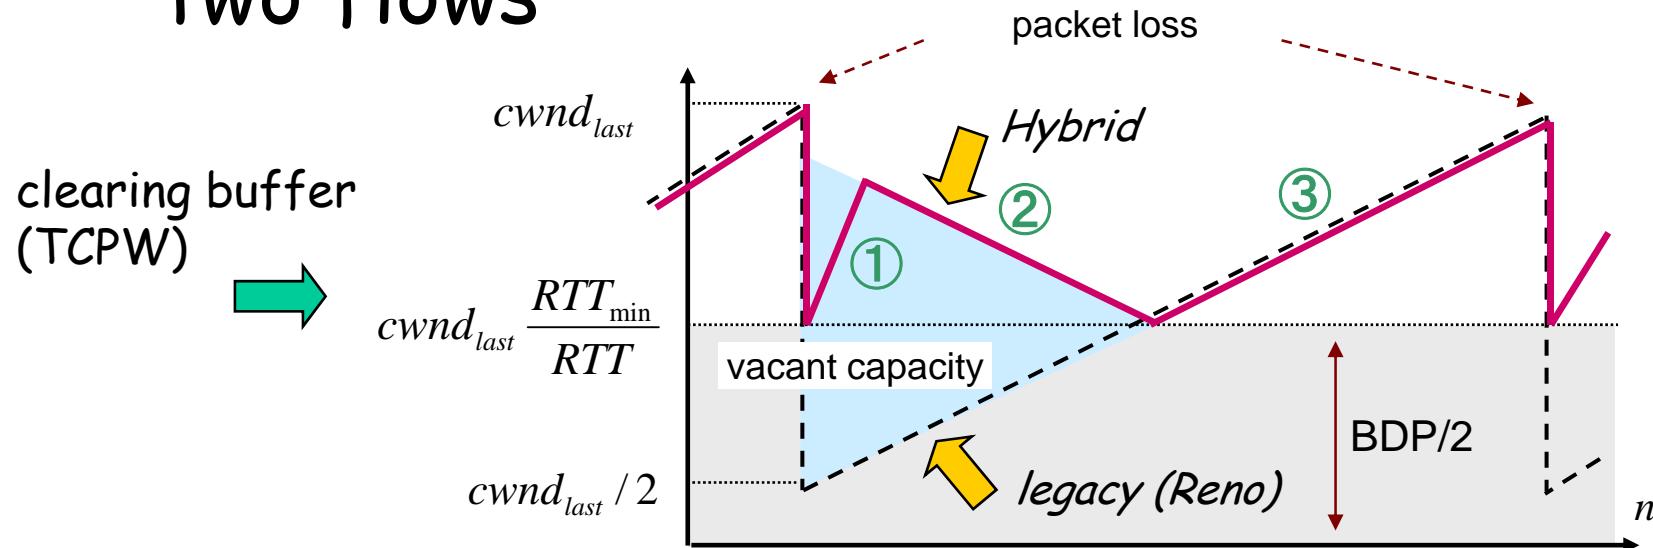

adaptive switching of two modes (loss & delay):

- ① constant rate until RTT increases (delay mode) : "efficiency" and "low delay"
- ② performs as Reno when RTT increases (loss mode) : "friendliness"

Hybrid TCP (2)

- two flows

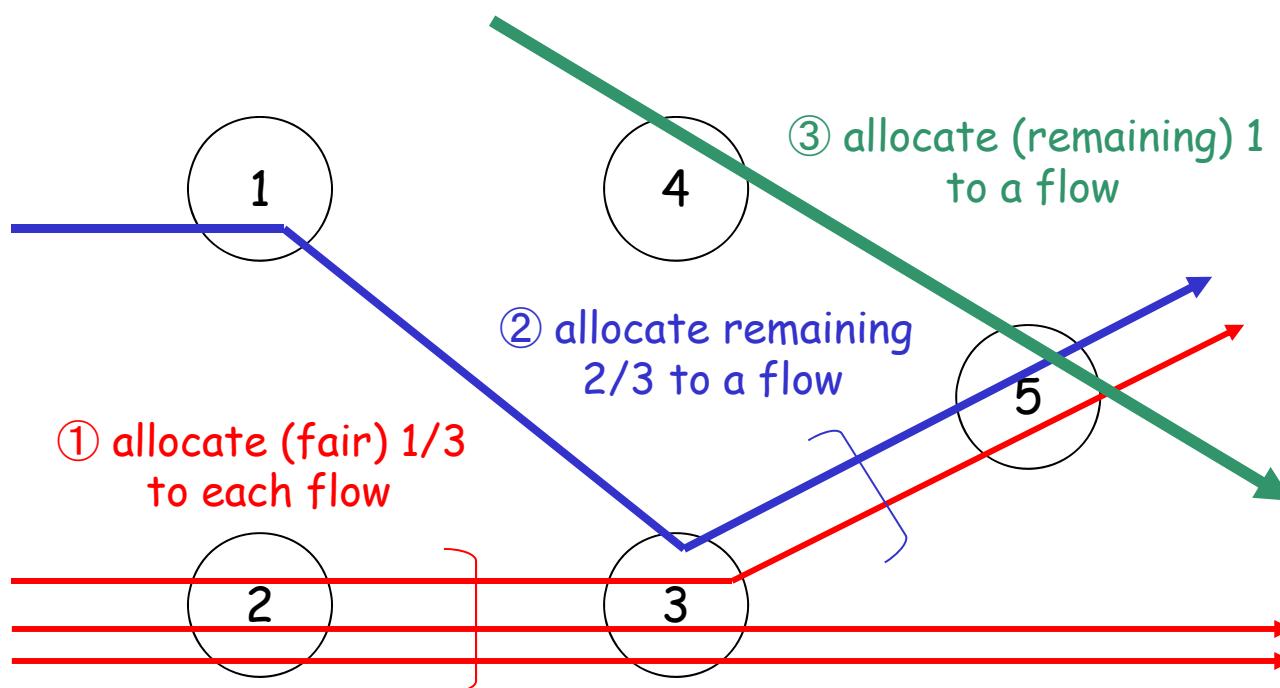

adaptive switching of two modes (loss & delay):

- ① fast cwnd increase (delay ... "efficiency")
- ② mild cwnd decrease (delay ... congestion avoidance)
- ③ performs as Reno when RTT increases (loss ... "friendliness")

Min-Max Fair (ideal case)

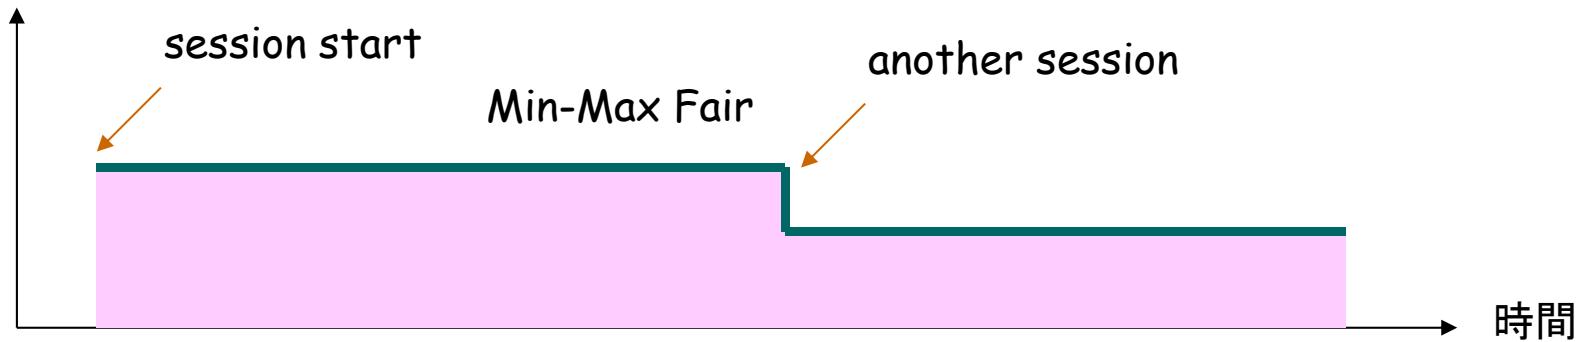

- Min-Max-Fair: allocate “maximum bandwidth” to a user who has “minimum bandwidth”

Ideal:

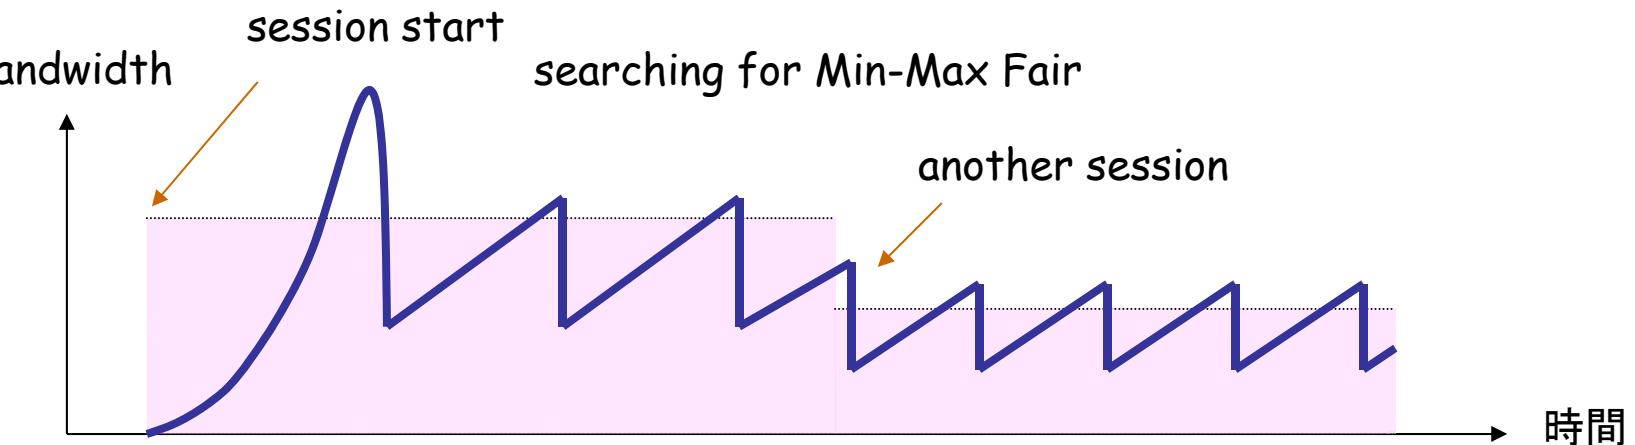

TCP's objective

bandwidth

TCP Reno

bandwidth

TCP behavior model (1)

- model definition
 - Loss-mode (TCP-Reno) :
 - $cwnd += 1$ (per "RTT round")
 - $cwnd *= 1/2$ (when a packet loss is detected)
 - Delay-mode :
 - fill a "pipe" (fully utilize a link) without causing RTT increase
 - Hybrid :
 - works in delay mode when RTT is not increased
 - works in loss mode when RTT is increases (i.e. when packets are buffered)
 - mode selection: $cwnd = \max(cwnd_{loss}, cwnd_{delay})$

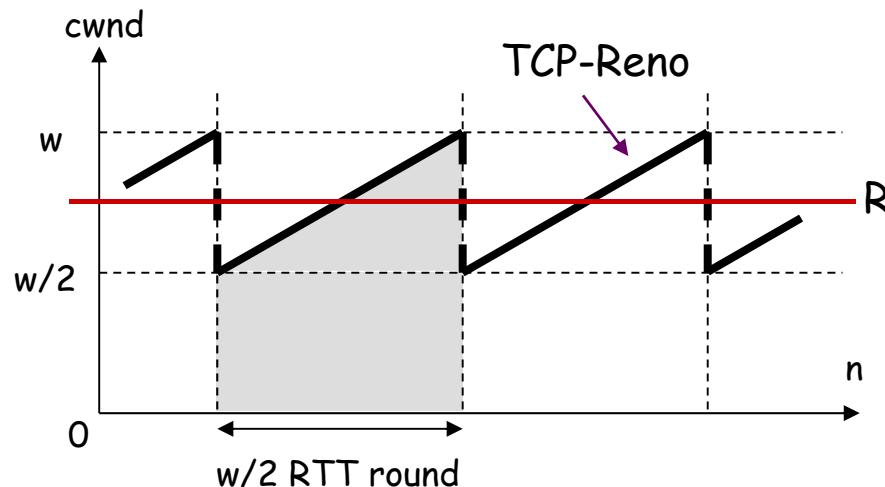

TCP behavior model (2)

- parameter definition
 - w : cwnd when a packet loss is detected
 - W : cwnd which just fills a pipe $\sim \text{BDP}$
 - p : packet loss rate
- assumption
 - packet loss due to buffer overflow is equivalent to packet loss due to random error

$$p = \frac{8}{3w^2} \quad (\text{in case of TCP-Reno})$$

TCP behavior model (3)

- TCP friendly model

w: cwnd when a packet loss is detected

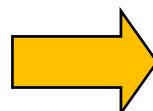

p: packet loss rate

RTT: round trip time

R: TCP equivalent rate

of transmitted packets until a packet loss is detected
= area of a trapezoid

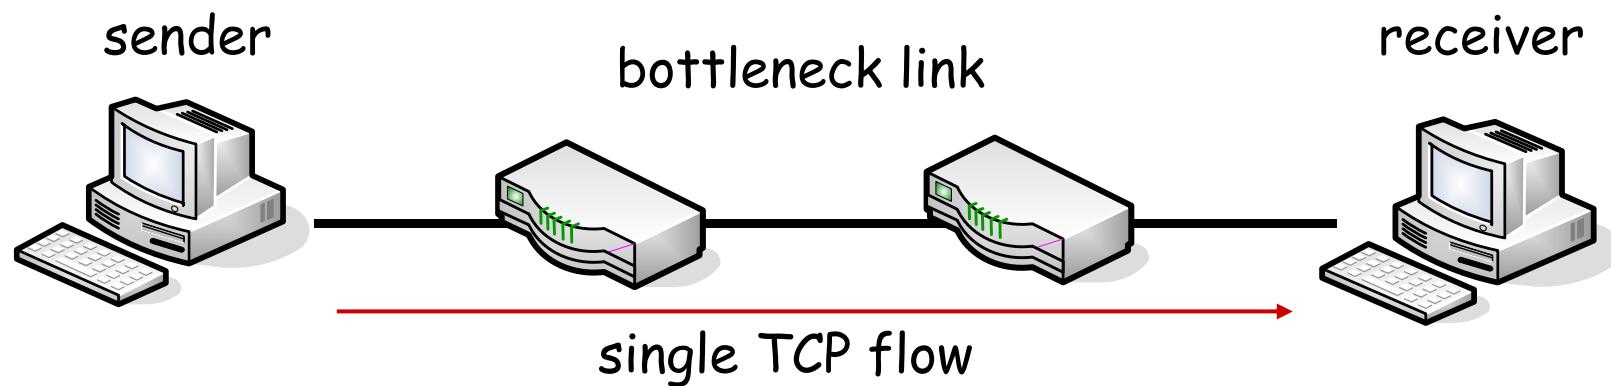

$$\frac{1}{2} \cdot \left(\frac{w}{2} + w \right) \cdot \frac{w}{2} = \frac{3w^2}{8}$$

$$\begin{cases} p = \frac{8}{3w^2} \\ R = \frac{PS}{RTT} \cdot \sqrt{\frac{3}{2p}} \end{cases}$$

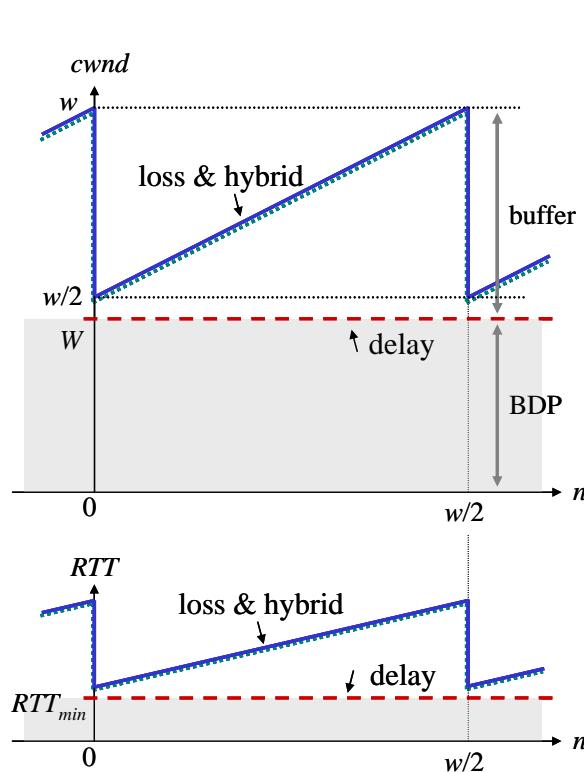

TCP behavior model (4)

- single flow

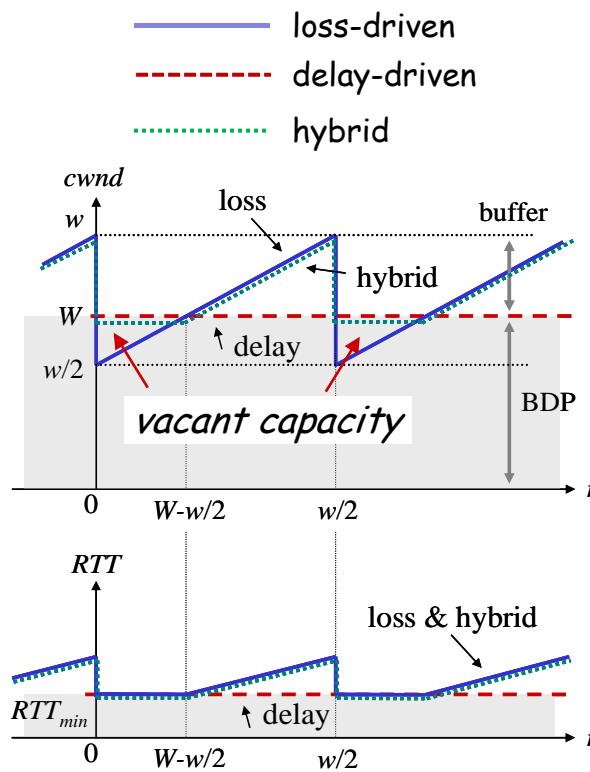

TCP behavior model (5)

- cwnd & RTT behaviors of ideal models (single flow case)

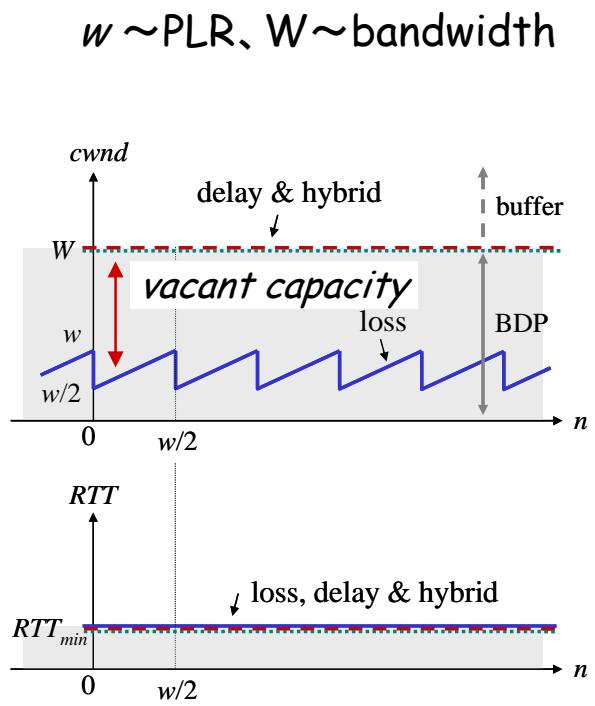

(i) $W < w/2$

large buffer, small PLR
(always loss-mode)

(ii) $w/2 < W < w$

small buffer, medium PLR
(delay ↔ loss)

(iii) $w < W$

large PLR, always vacant
(always delay-mode)

TCP behavior model (6)

- formulation

TCP	CA round	(i) $W < w/2$	(ii) $w/2 \leq W < w$	(iii) $w \leq W$
Loss	transmitted packets	$\frac{3}{8}w^2$	$\frac{3}{8}w^2$	$\frac{3}{8}w^2$
	elapsed time	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{8}(3w^2 - 4wW) \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{2}(w-W)^2 \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min}$
Delay	transmitted packets	$\frac{1}{2}w \cdot W$	$\frac{1}{2}w \cdot W$	$\frac{1}{2}w \cdot W$
	elapsed time	$\frac{1}{2}w \cdot RTT_{\min}$	$\frac{1}{2}w \cdot RTT_{\min}$	$\frac{1}{2}w \cdot RTT_{\min}$
Hybrid	transmitted packets	$\frac{3}{8}w^2$	$\frac{1}{2}w \cdot W + \frac{1}{2}(w-W)^2$	$\frac{1}{2}w \cdot W$
	elapsed time	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{8}(3w^2 - 4wW) \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{2}(w-W)^2 \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min}$

PS: Packet size, B: Link bandwidth

TCP behavior model (7)

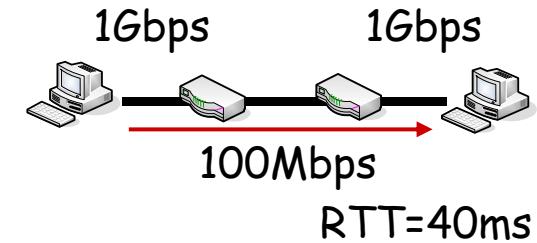

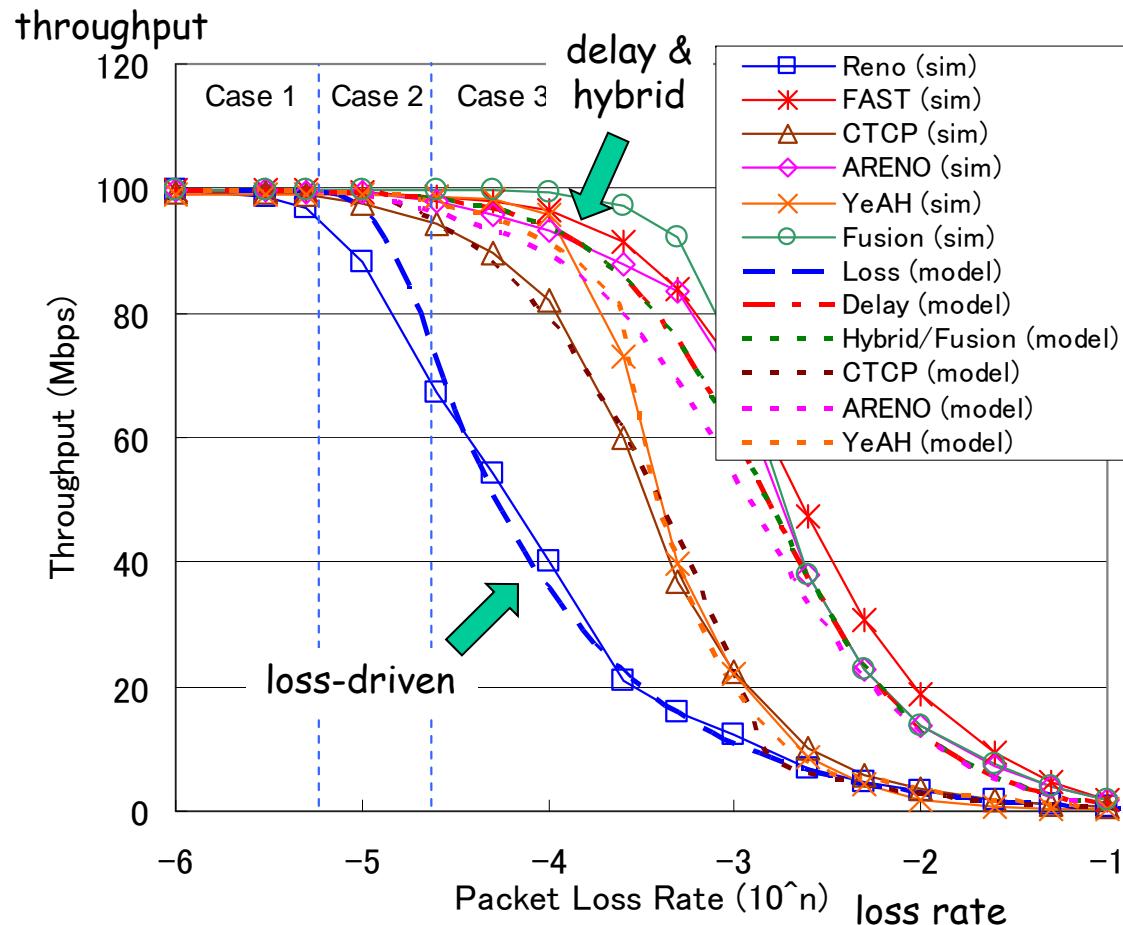

- abstraction of actual hybrids

Hybrids	Window increase	Window decrease
Compound TCP	$0.125 * \text{cwnd}^{0.75}$	1/2
ARENO	$B/10\text{Mbps}$	1/2~1
YeAH-TCP	Scalable TCP (1.01)	1/2, $\text{RTT}_{\min}/\text{RTT}$, 7/8
TCP-Fusion	$B * D_{\min} / (N * PS)$	$\text{RTT}_{\min}/\text{RTT}$

D_{\min} : timer resolution, N: # of flows

TCP behavior model (8)

- evaluation by models and simulations

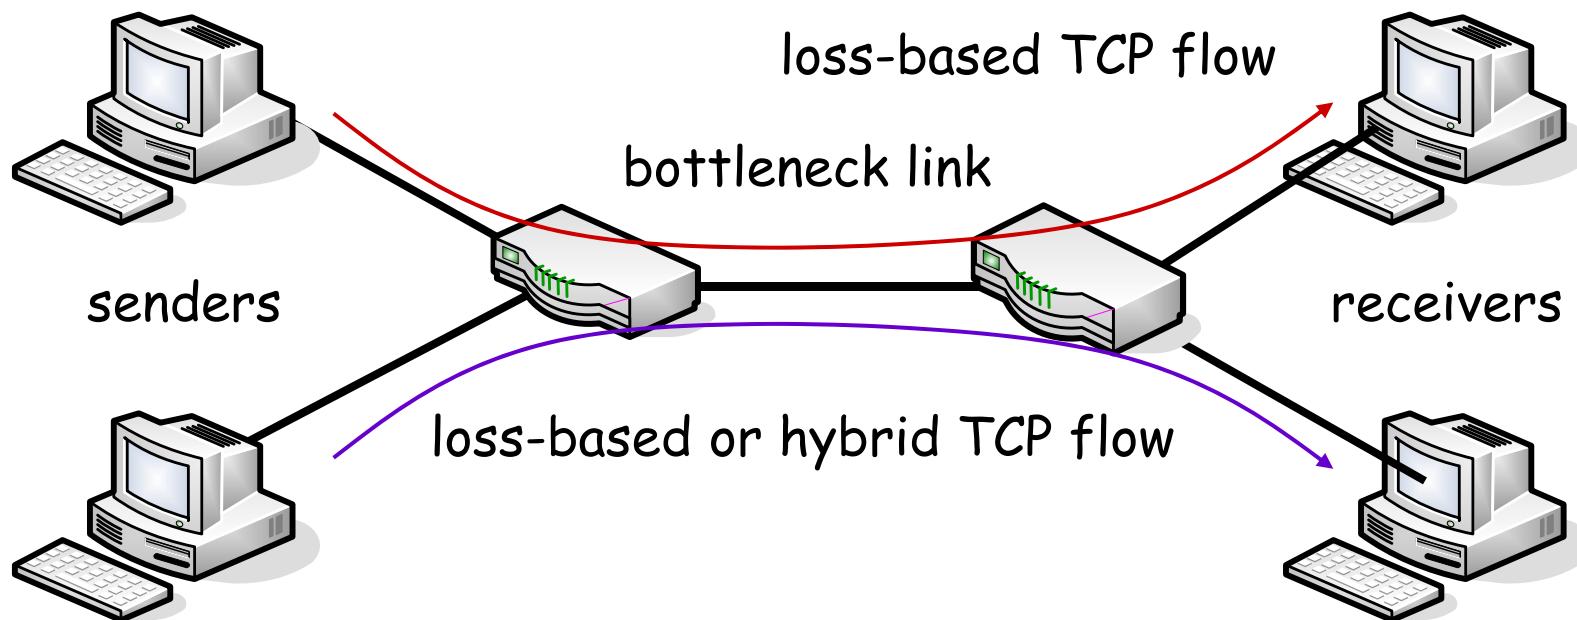

buffer size = BDP (constant)
Packet loss rate : variable

when PLR is large ($w/2 < W$),
throughputs of delay &
hybrid are much larger than
that of loss-mode (i.e.
efficiency)

degradation of Compound &
YeAH is due to fixed window
decrease

TCP behavior model (9)

- two flows (competing)

TCP behavior model (10)

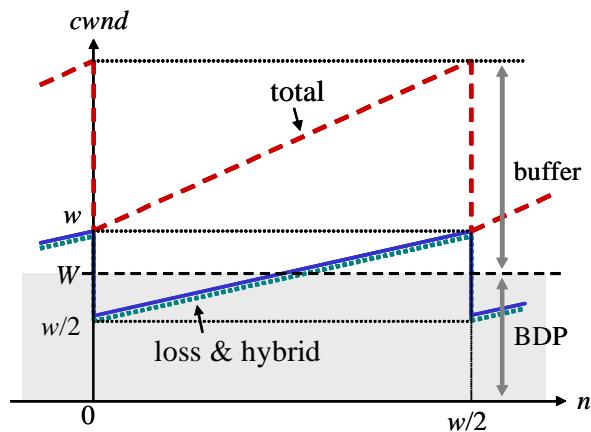

- cwnd behavior of ideal models (two flow case)

— loss-driven

··· hybrid

- - total (loss + hybrid)

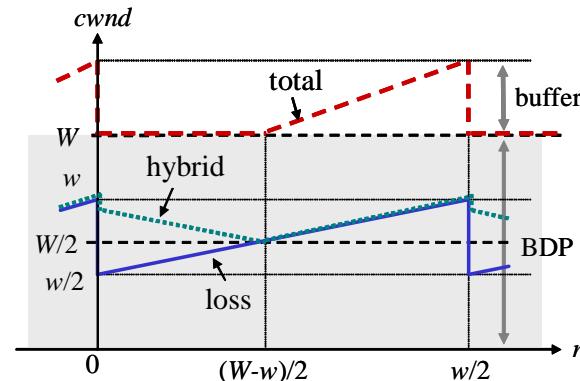

$w \sim \text{PLR}$, $W \sim \text{bandwidth}$

(i) $W < w$ (low PLR)

always buffered
(loss mode)

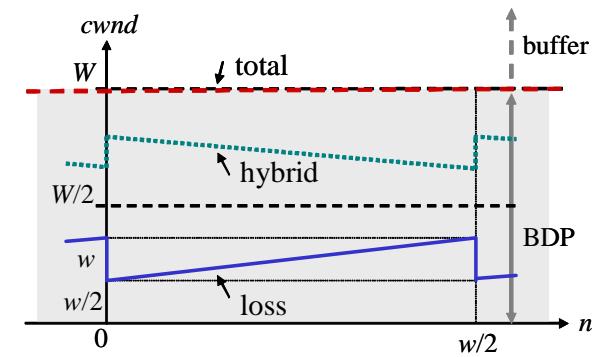

large buffer, small PLR

(ii) $w < W < 2w$ (medium PLR)

vacant \rightarrow buffered
(delay \rightarrow loss)

small buffer, medium PLR

(iii) $2w < W$ (high PLR)

always vacant
(delay mode)

large PLR, always vacant

TCP behavior model (11)

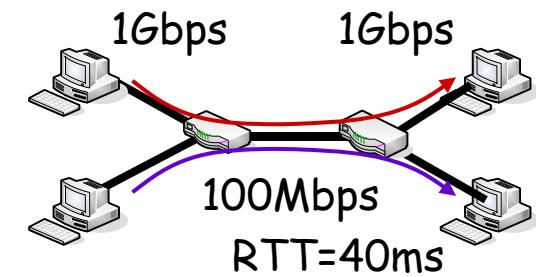

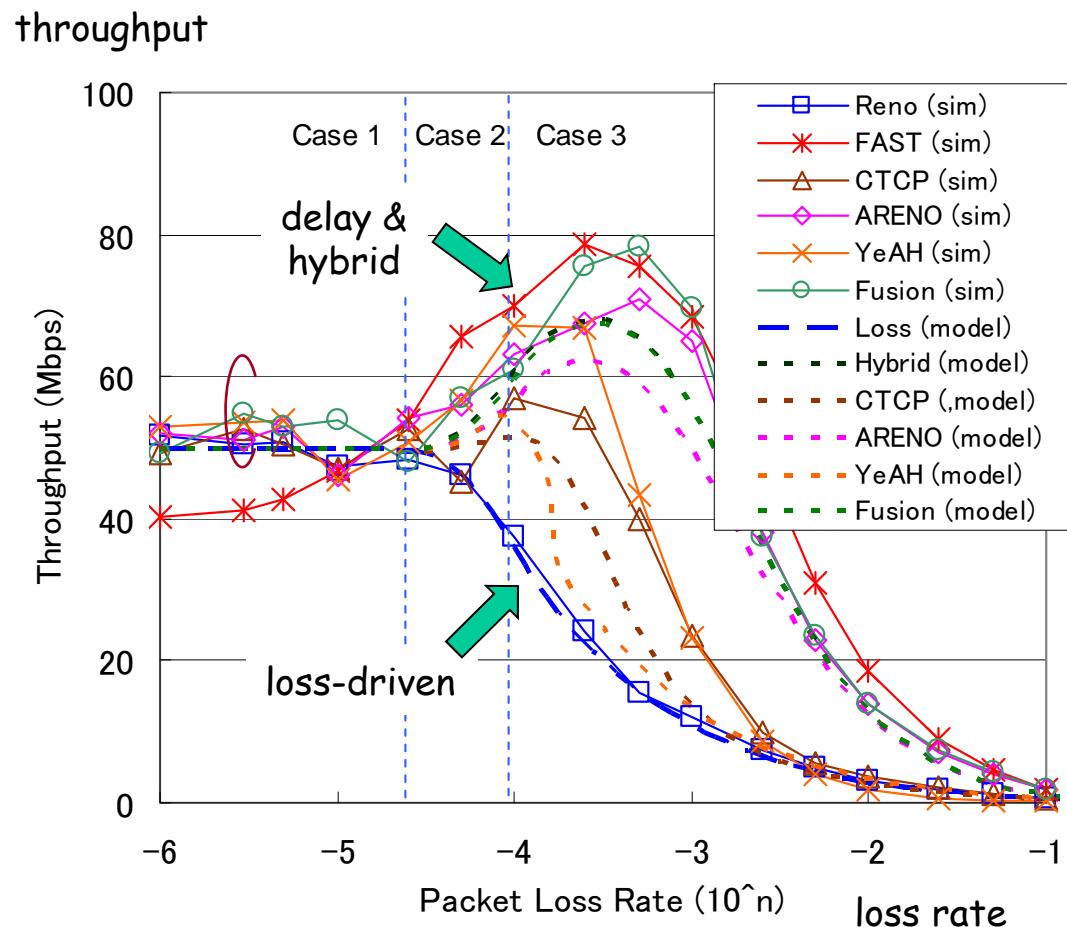

- formulation

TCP	CA round	(i) $W < w$	(ii) $w \leq W < 2w$	(iii) $2w \leq W$
Loss	transmitted packets	$\frac{3}{8}w^2$	$\frac{3}{8}w^2$	$\frac{3}{8}w^2$
Hybrid	transmitted packets	$\frac{3}{8}w^2$	$\frac{3}{8}w^2 + \frac{1}{4}(W-w)^2$	$\frac{1}{2}w \cdot W - \frac{3}{8}w^2$
(common)	elapsed time	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{4}w(3w-2W) \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min} + \frac{1}{4}(2w-W)^2 \cdot \frac{PS}{B}$	$\frac{1}{2}w \cdot RTT_{\min}$

PS: Packet size, B: Link bandwidth

TCP behavior model (12)

- evaluation by models and simulations

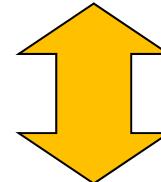

buffer size = BDP (constant)
Packet loss rate : variable

when PLR is large ($w < W$),
throughputs of delay &
hybrid are much larger than
that of loss-mode
(efficiency)

when PLR is low ($w > W$),
hybrid behaves similar to
loss-mode **(friendliness)**

TCP behavior model (13)

- Advantages of Hybrid TCP
 - when vacant capacity exists (or PLR is large), throughput efficiency is greatly improved (advantage of delay-mode)
 - when no vacant capacity exists (or buffer size is large), friendliness to legacy TCP (i.e. Reno) is achieved (advantage of loss-mode)
- Disadvantages of Hybrid TCP
 - when buffer size is large, delay-mode is never activated ...

Summary of Hybrid TCP

- “Efficiency”, “Friendliness” and “Low delay”
 - can be applied to real-time streaming and large file download
 - might be effective in wireless networks
 - friendliness to CUBIC-TCP or Compound-TCP
 - CUBIC-TCP: Linux default
 - Compound-TCP: Windows
 - other metrics
 - RTT fairness, mice/elephant (short-lived or long-lived), convergence speed, etc...
 - efficiency is brought by delay-mode

Summary

Summary of TCP versions

- CUBIC-TCP provides “efficiency”, but tends to increase latency because router buffers are filled up
- Compound-TCP provides “low delay” thanks to its delay mode, but suffers from unfriendliness against CUBIC-TCP
- Some community discusses redesign of TCP
